INTRODUCTION

This is the fifth edition of the North American regional studbook for the hooded crane, *Grus monacha*. This studbook contains the records for living animals through 15 November 2008. I have recorded the information as it was given to me.

The Population Management Plan was recently published and circulated independent of the studbook. Any errors or questions regarding the information about any specimen should be reported to the studbook keeper at the address and phone number listed below.

I would like to acknowledge the contributions of Jeff Greschner, the previous International Hooded Crane Studbook Keeper, Dr. Kazutoshi Takami current International Hooded Crane Studbook Keeper, Sharon Reilly, Conservation Biologist of the International Crane Foundation, Nannette Bragin, Registrar of the Denver Zoological Gardens and Kristen Kovar, AZA Population Biologist.

Sincerely,

John V. Azua
North American Regional Hooded Crane Studbook Keeper

HOODED CRANE

NATURAL HISTORY

The hooded crane, *Grus monacha*, is a medium-sized crane with a gray body and a white head except for the “head” of bare red skin above eye on the forehead. They can have a length measure of approximately 100 cm, weigh between 3200-2800 grams and have a wingspan of 160-180 cm. A juvenile has a brown tinged plumage with a black and white crown. These birds have high pitched calls used in tandem with elaborate dances for territorial and courtship displays

Present Status

The total population of Hooded Cranes (*Grus monacha*) is estimated at 9,400-9,600. The breeding grounds of the species are in southeastern Russia and northern China, while non-breeding flocks occur in the Russia-China border region. The species is divided into several wintering subpopulations. More than 80% of the world’s Hooded Cranes spend the winter at Izumi on the Japanese island of Kyushu, where they are sustained by artificial feeding. Small subpopulations are found at Yashiro in southern Japan, near Taegu in South Korea, and at several sites along the middle Yangtze River in China. Although little is known about historical changes in the distribution of the species, its numbers are known to have fluctuated dramatically since the 1920s. At present, the population is probably as large as at any point this century. This species is classified as Vulnerable under the revised IUCN Red List criteria.

General Ecology

Hooded cranes nest in isolated, widely scattered bogs in the taiga and in other forested wetlands, preferring mossy areas with widely scattered larch trees (*Larix* spp.), and avoiding areas that are either too open or too densely forested. Non-breeding cranes are found in shallow open wetlands, natural grasslands, and agricultural fields in southern Siberia, northeastern Mongolia, and northern China. Wintering Hooded Cranes use a variety of habitats. In China, they tend to roost along the shores of rivers and shallow lakes, and to forage in the nearby grasslands, grassy marshes, rice paddies, and agricultural fields. In Korea and Japan they feed almost exclusively at feeding stations and in agricultural fields.

Threats to Species Survival

Although the Hooded Crane is a threatened species, it is more secure than other threatened cranes of East Asia. This is due mainly to the relative absence of intensive human economic activity in their breeding grounds. Moreover, the species (unlike the other East Asian cranes) winters primarily in Japan rather than China and the Korean Peninsula, where threats are somewhat greater. However, the species does face several critical threats, including: drainage of wetlands and intensified logging in Russia’s taiga forests; reclamation of wintering grounds in China for agriculture and alterations in the hydrology of these areas; the planned Three Gorges dam on the Yangtze River; rapid development of the key wintering grounds on Korea, especially through the construction of greenhouses; and high risk of disease outbreak in the concentrated flocks at the winter feeding stations in Japan.

Conservation Priorities

Conservation measures that have been undertaken include: (1) legal protection throughout the species' range; (2) international agreements to protect the species and key habitats throughout its range; (3) recently expanded research on breeding habitats, winter ecology, and migration routes; (4) annual surveys of populations in the wintering grounds; (5) establishment of protected areas, especially in the winter range; and (6) intensive management (including artificial feeding programs) at the main wintering area in Japan.

The Hooded Crane has many of the same priority conservation needs as the White-naped, red-crowned and Siberian Cranes, including stronger enforcement of existing laws, adoption of an umbrella agreement on the migratory cranes of East Asia, adoption of the Ramsar Convention all range countries, expanded international conservation programs, continued research on migration routes, and protection of key habitats in china and the Korean Peninsula.

Additional priorities specific to the species include: protection of potential alternative feeding and roosting sites for the wintering populations in southern Japan and Korea; studies of the West Taegu population in Korea and application of this information in creating an adequate protected area for the flock; control in and near the Hooded Crane Protection Area in Korea; continued winter surveys of all Hooded Crane populations; and development of a program to monitor the status of the breeding grounds in Russia.

Adapted from Status, Survey, Conservation Action Plan-The Cranes (IUCN 1996).

STUDBOOK FORMAT

Studbook number. This is a permanent assigned number to a specific animal. Previous numbers prefixed by a “T” were temporary numbers, and should be removed under the studbook number field and the permanent number replaced. They can be referred to under other comments.

Sex. Male, Female, Unknown

Birthdate. Recorded in European style (day, month, then year). Animals of unknown origin are indicated with question marks.

Sire/Dam. If the dam and sire are known, they are recorded by their studbook number. If the animal came from the wild, dam and sire are listed as wild. If the parentage is unknown, dam and sire are listed as unknown. If more than one animal could be the dam or sire, and is in the studbook, that field is listed as “MULT”.

Location. This is either the present location of the animal, the prior location when it died, or the last known location it’s been.

Date. This is the date the event occurred.

Local ID. This is usually the animal’s accession number, but may also be an institution’s local ID number.

Event. This is the event being recorded, ie: birth, death, transfer, etc.

Removal Date. This is the date when the animal was removed from an institution. If an animal cannot be traced past a certain date or is sent to an institution which has not updated the animal’s status, the animal is listed as “lost to followup”. Under this circumstance this column would read “unknown”.

Taxon. This is the genus, species, and sub-species, if known.

House name. This is the animal’s house name used by the latest institution where it was housed.
